ColdMark Freeze Indicator Storage and Handling Instructions

1. The ColdMark Freeze Indicator is self-activating; there is no activator tab to pull. If the ColdMark Indicator is exposed to temperatures below its response temperature, the bulb of the indicator irreversibly changes from clear and colorless to a violet color.

2. The shelf life for the ColdMark indicator is 24 months from date of manufacture.

3. The ColdMark Freeze Indicator may be stored at room temperature or placed in cool storage, provided the storage temperature is at least 5°C above the stated response temperature of the indicator. This 5°C allowance anticipates that there may be random cold pockets in the facility where the indicators are being stored.

4. The shelf life can be extended until 42 months, provided these labels are stored between 8°C - 24°C.

5. To apply a ColdMark Indicator, the release liner must be peeled from the back of the Indicator exposing the pressure sensitive adhesive, and the Indicator adhered to a dry surface. The release liner is most easily peeled from the bulb end of the indicator.

6. The ColdMark Freeze Indicator activates at its stated response temperature ± 1°C.

7. Do not expose indicators to temperatures above 43°C.
